

Topic Implementation/Enhancement of SAP ERP 6.0
Customer Aluminiumschmelzwerk Oetinger GmbH
Task Design and implementation of an integrated business process in ERP. Implementation of inventory management (SAP MM) and process manufacturing All data management has to take place in the SAP ECC.
Implementation Several legacy systems at the „Weißenhorn“ location were detached during the project and the use of the SAP ECC was enlarged. The new solution is now the basis for the Roll-Out across the group. The previously isolated processes that took place on different systems were merged into one harmonised and integrated process. The usability could have been strongly optimised by using the WebDynpro technology. An inventory management system based on handling units was implemented to meet the requirement of daily fluctuating metal prices and to represent the differing material qualities. Industry-specific requirements, like charge make-up, were covered by add-ons implemented by one of our partners. These add-ons are supported by ECC. The following activities were carried out by PIKON: <ul style="list-style-type: none">▪ Concept, Customizing and realisation of the SD, MM, PP-PI, CO, LO modules▪ Design and implementation of programs with WebDynpro▪ Implementation of forms with Adobe-Forms.
