

**Topic**

Implementation of the **Hager Internet Sales Portal (HISP)**

**Customer**

Hager Electro GmbH, Blieskastel

**Task**

Making available a user-friendly and efficient interface for purchase order administration to all sales companies and production sites of Hager Electro throughout the world. This interface should, among other things, provide an automated distribution of the individual purchase order items to the different logistics centers (and thus to the different SAP systems).

**Implementation**

A web application was implemented using BSP and HTMLB. It provides a user-friendly desktop with the following functions:

- Web-based order entry with access to the data and availability of all products, irrespective of the individual production site, logistics center, and SAP client.
- Automatic order generation in the individual SAP systems.
- Simulation of pricing, availability check, and synchronization of the requested delivery date.
- Available information on the order status at any time.
- Extensive alteration with automated reporting is possible even in the order process.
- Reprint of documents (order confirmation, delivery note,

and invoice).
