

Issue

PACE at Siemens PG I

Customer

The Siemens division “Power Generation Industrial” produces, among other products, compressors and turbines and employs more than 10,000 men and women worldwide.

Task

Design and Programming of an order query (Auftragsspiegel) using ABAP Objects.

Realisation

As the after-sales service of Engineering and Construction offers many small projects, an evaluation compiling the most important key figures per order is required. This list was developed using ABAP Objects and contains the following features:

- Presentation of both the projects and the sales orders in one common list.
- Selections can be based on PS or SD data.
- Columns can be defined per customizing.
- Selection can be executed in the background (saving of an extract), while the evaluation is performed online using ALV (ABAP List Viewer). It offers functionalities such as the definition of tailor-made display variants, print, sending Emails, download to Excel, etc.
